                                                                                                                                                                                                                                                                                  ology 193:868-876(1993).

FUNCTION: Removes the terminal stalic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.

CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal stalic residues in eligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                   -i. FUNCTION: Removes the terminal sialic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.
-i. CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->8)-glycosidic linkages of terminal sialic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                          VIOLOGY 193:868-876(1993).

-!- FUNCTION: Removes the terminal sialic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.

-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->6)-, oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            IKKA HUMAN STANDARD; PRT; 745 AA.

                                                                                                                                           Virology 193:868-876(1993).

-!- FUNCTION: Removes the terminal sialic acid from carbohydrate side chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and facilitate the mobility of the virus to and from the site of infection.

-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->6)-glycosidic linkages of terminal sialic residues in oligosaccharides, glycoptoteins, glycolipids, colominic acid and synthetic substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                 SUBCELLULAR LOCATION: VIRAL MEMBRANE. FORMS A MUSHROOM-SHAPED SPIKE ON THE SURFACE OF THE VIRION. SIMILARITY: BELONGS TO FAMILY 34 OF GLYCOSYL HYDROLASES.

 when dephosphorylated.
-!-SUBUNIT: Preferentially found as a heterodimer with IKK-beta but also as an homodimer. Directly interacts with IKK-beta but also as an homodimer. Directly interacts with IKK-GAMMA/NEMO.
Heterodimers form the active complex. The tripartite complex can also bind to MAP3K14/NIK, MEKK1, IKAP and IKB-alpha-P65-P50 complex. A weak interaction with TRAF2 cannot be excluded. Part of a complex composed of NCOA2, NCOA3, IKKB, IKBKG and CREBBP.
-!-SUBCELLULAR LOCATION: Cytoplasmic.
-!-TISSUE SPECIFICITY: Widely expressed.
-!-PTM: Phosphorylated by MAP3K14/NIK, AKT and to a lesser extent by MEKK1, and dephosphorylated by PP2A. Autophosphorylated.
-!-SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
IKAPPAB KINASE SUBFAMILY.
 "Regulation of SRC-3 (pCIP/ACTR/AIB-1/RAC-3/TRAM-1) coactivator activity by I kappa B kinase.";
Mol. Cell. Biol. 22:3549-3561(2002).
-I- FUNCTION: Phosphorylates inhibitors of NF-kappa-B thus leading to the dissociation of the inhibitor/NR-kappa-B complex and ultimately the degradation of the inhibitor. Also phosphorylates

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
 February 18, 2004, 14:16:39; Search time 7.06579 Seconds (without alignments) 35.929 Million cell updates/sec

Sequence 3, Application US/08887518
Patent No. 5843721
GENERAL INFORMATION:
APPLICANT: Wothe, Mike
APPLICANT: Wothe, Mike
APPLICANT: Wother With Application of INVENTION: NIK Proteins, Nucleic Acids and Methods NUMBER OF SEQUENCES: 4
CORRESPONDENCES: ADDRESS:
ADDRESSEE: SCIENCE & TECHNOLOGY LAW GROUP
STREET: 268 BUSH STREET, SUITE 3200
 Query Match 100.0%; Score 40; DB 2; Length 745; Best Local Similarity 100.0%; Pred. No. 1.4e+02; Matches 6; Conservative 0; Mismatches 0; Indels
 STATE: CALLETONING.
COMPUTRY: USA
ZIP: 94104
ZIP: 94104
ZIP: 94104
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTRI: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTIN DATA:

 d
 -!- SUBUNIT: Preferentially found as a heterodiner with IKK-beta but also as an homodimer. Directly interacts with IKK-GAMMA/NEMO. Heterodiners form the active complex. The tripartite complex can also bind to MAP3K14/NIK, MEKK1, IKAP and IKB-alpha-P65-P50 complex. A weak interaction with TRAF2 cannot be excluded. Part of a complex. Composed of NCOA2, NCOA3, IKKB, IKBKG and CREBBP.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Widely expressed.
-!- PTM: Phosphorylated by MAP3K14/NIK, AKT and to a lesser extent by MEKK1, and dephosphorylated by PP2A. Autophosphorylated.
-!- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
 Nemoto S., Dibonato J.A., Lin A.; "Coordinate regulation of IkappaB kinases by mitogen-activated protein kinase kinase kinase kinase kinase kinase (1 and WF-kappaB-inducing kinase."; Mol. Cell. Biol. 18:7336-7343(1998).

R. Mol. Cell. Biol. 22:3549-3561(2002).

C. -I-FUNCTION: Phosphorylates inhibitor/NF-kappa-B complex and the dissociation of the inhibitor. Also phosphorylates (CC Ultimately the degradation of the inhibitor. Also phosphorylates (CC NCOA3 (By similarily) found as a heterodimer with IKK-alpha but also as a homodimer. Directly interacts with IKK-alpha but also bind to MEKK1, MAPSIK1/NIK, IKAP and IKB-alpha-P65-P50 complex. Phosphorylated IKB-alpha is further released from the complex. Pound in a complex composed of NCOA2, NCOA3, IKKA, IKBKG

 LYTOSINE phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TSSUE SPECIFICITY: HIGHLY EXPRESSED IN THE DEVELOPING BRAIN AND EMBRYONIC TISSUES. IN ADULT THE GREATEST LEVELS OF EXPRESSION OCCURS. IN THE BRAIN. IT IS EXPRESSED IN A GRADED MANNER ACROSS THE RETINA WITH THE HIGHEST EXPRESSION AT ITS TEMPORAL POLE.
-!- SIMILARITY: Contains 1 serile alpha motif (SAM) domain.
-!- SIMILARITY: Contains 2 fibronectin type III domains.
-!- SIMILARITY: BELONGS TO THE TYR FAMILY OF PROTEIN KINASES. EPHRIN
